

CS499 Project#4:: SSL Analysis

Due: Monday, Nov 22, 2010

Before class

submission: submit hardcopy in class.

In this lab, we'll investigate the Secure Sockets Layer (SSL) protocol, focusing on the SSL records sent over a TCP connection. We'll do so by analyzing a trace of the SSL records sent between your host and an e-commerce server. We'll investigate the various SSL record types as well as the fields in the SSL messages.

The image shows a Wireshark capture of an SSL handshake and application data exchange. The filter is set to 'ssl'. The packet list shows the following packets:

No.	Time	Source	Destination	Protocol	Info
106	21.805705	128.238.38.162	216.75.194.220	SSLv2	Client Hello
108	21.830201	216.75.194.220	128.238.38.162	SSLv3	Server Hello,
111	21.853520	216.75.194.220	128.238.38.162	SSLv3	Certificate
112	21.876168	128.238.38.162	216.75.194.220	SSLv3	Client Key Exchange, Change Cipher S
113	21.945667	216.75.194.220	128.238.38.162	SSLv3	Change Cipher Spec, Encrypted Handsh.
114	21.954189	128.238.38.162	216.75.194.220	SSLv3	Application Data
122	23.480352	216.75.194.220	128.238.38.162	SSLv3	Application Data
123	23.481632	216.75.194.220	128.238.38.162	TCP	[TCP segment of a reassembled PDU]
127	23.482041	216.75.194.220	128.238.38.162	SSLv3	[TCP out-of-order] Application Data
129	23.482615	216.75.194.220	128.238.38.162	TCP	[TCP segment of a reassembled PDU]
138	23.537378	216.75.194.220	128.238.38.162	SSLv3	[TCP out-of-order] Application Data
140	23.537671	216.75.194.220	128.238.38.162	TCP	[TCP segment of a reassembled PDU]

The packet details pane shows the following information for the selected packet (Frame 106):

- Frame 106 (132 bytes on wire, 132 bytes captured)
- Ethernet II, Src: IBM_10:60:99 (00:09:6b:10:60:99), Dst: All-HSRP-routers_00 (00:00:0c:07:ac:00)
- Internet Protocol, Src: 128.238.38.162 (128.238.38.162), Dst: 216.75.194.220 (216.75.194.220)
- Transmission Control Protocol, Src Port: 2271 (2271), Dst Port: https (443), Seq: 1, Ack: 1, Len: 132
- Secure Socket Layer
 - SSLv2 Record Layer: Client Hello
 - Length: 76
 - Handshake Message Type: Client Hello (1)
 - Version: SSL 3.0 (0x0300)
 - Cipher Spec Length: 51
 - Session ID Length: 0
 - Challenge Length: 16
 - Cipher Specs (17 specs)

The packet bytes pane shows the raw data of the Client Hello message, including the handshake message type, version, cipher spec length, session ID length, challenge length, and cipher specs.

1. Capturing packets in an SSL session

The first step is to capture the packets in an SSL session. To do this, you should go to your favorite e-commerce site and begin the process of purchasing an item (but terminating before making the actual purchase!). After capturing the packets with Wireshark, you should set the filter so that it displays only the Ethernet frames that contain SSL records sent from and received by your host. (An SSL record is the same thing as an SSL message.) You should obtain something like screenshot on the previous page.

2. A look at the captured trace

Your Wireshark GUI should be displaying only the Ethernet frames that have SSL records. It is important to keep in mind that an Ethernet frame may contain one or more SSL records. (This is very different from HTTP, for which each frame contains either one complete HTTP message or a portion of a HTTP message.) Also, an SSL record may not completely fit into an Ethernet frame, in which case multiple frames will be needed to carry the record.

1. For each of the first 8 Ethernet frames, specify the source of the frame (client or server), determine the number of SSL records that are included in the frame, and list the SSL record types that are included in the frame. Draw a timing diagram between client and server, with one arrow for each SSL record.
2. Each of the SSL records begins with the same three fields (with possibly different values). One of these fields is “content type” and has length of one byte. List all three fields and their lengths.

ClientHello Record:

3. Expand the ClientHello record. (If your trace contains multiple ClientHello records, expand the frame that contains the first one.) What is the value of the content type?
4. Does the ClientHello record contain a nonce (also known as a “challenge”)? If so, what is the value of the challenge in hexadecimal notation?
5. Does the ClientHello record advertise the cipher suites it supports? If so, in the first listed suite, what are the public-key algorithm, the symmetric-key algorithm, and the hash algorithm?

ServerHello Record:

6. Locate the ServerHello SSL record. Does this record specify a chosen cipher suite? What are the algorithms in the chosen cipher suite?

7. Does this record include a nonce? If so, how long is it? What is the purpose of the client and server nonces in SSL?
8. Does this record include a session ID? What is the purpose of the session ID?
9. Does this record contain a certificate, or is the certificate included in a separate record. Does the certificate fit into a single Ethernet frame?

Client Key Exchange Record:

10. Locate the client key exchange record. Does this record contain a pre-master secret? What is this secret used for? Is the secret encrypted? If so, how? How long is the encrypted secret?

Change Cipher Spec Record (sent by client) and Encrypted Handshake Record:

11. What is the purpose of the Change Cipher Spec record? How many bytes is the record in your trace?
12. In the encrypted handshake record, what is being encrypted? How?
13. Does the server also send a change cipher record and an encrypted handshake record to the client? How are those records different from those sent by the client?

Application Data

14. How is the application data being encrypted? Do the records containing application data include a MAC? Does Wireshark distinguish between the encrypted application data and the MAC?
15. Comment on and explain anything else that you found interesting in the trace.
